DEPARTMENT OF HEALTH AND HUMAN SERVICES
FOOD AND DRUG ADMINISTRATION
CENTER FOR DRUG EVALUATION AND RESEARCH

JOINT MEETING
NONPRESCRIPTION DRUGS ADVISORY COMMITTEE AND
PULMONARY - ALLERGY DRUGS ADVISORY COMMITTEE

Friday, May 11, 2001

8:00 a.m.

Holiday Inn
Gaithersburg, Maryland

P A R T I C I P A N T S

NONPRESCRIPTION DRUGS ADVISORY COMMITTEE MEMBERS

Eric P. Brass, M.D., Ph.D., Chairman

Sandra Titus, Ph.D. Executive Secretary

MEMBERS:

Richard A. Neill, M.D.

Hari C. Sachs, M.D.

Edward P. Krenzelok, Pharm.D.

Edwin E. Gilliam, Ph.D.

Louis R. Cantilena, Jr., M.D., Ph.D.

Julie A. Johnson, Pharm.D.

Henry Will Williams, Jr., M.D.

Y.W. Francis Lam, Pharm.D.

Donald L. Uden, Pharm.D.

George A. Blewitt, M.D., Industry Liaison
(Non-Voting)

CONSULTANTS:

Leslie Clapp, M.D.

Ralph D'Agostino, Ph.D.

Sonia Patten, Ph.D., Consumer Representative

Alastair Wood, M.D.

PULMONARY ALLERGY DRUGS ADVISORY COMMITTEE MEMBERS

H. William Kelly, Pharm.D.

Brenda H. Conner, Consumer Representative

William M. Vollmer, Ph.D.

Andrea J. Apter, M.D.

Jesse Joad, M.D.

Mark S. Dykewicz, M.D.

Robert J. Fink, M.D.

Jean G. Ford, M.D.

Michael S. Niederman, M.D.

CONSULTANTS:

James Barainuk, M.D. (Non-Voting)

Dan Roden, M.D.

FDA:

Robert Temple, M.D.

Charles Ganley, M.D.

John Jenkins, M.D.

Sandra Kweder, M.D.

Robert Meyer, M.D.

C O N T E N T S

Call to Order and Introductions, Eric Brass, M.D.	5
Conflict of Interest Statement, Sandra Titus, Ph.D.	9
Welcome and Introduction to Today's Issues, Charles Ganley, M.D.	11
Blue Cross Petition:	
Comments, Robert Seidman, Pharm.D., M.P.H.	16
Comments, Jack Kern, Pharm.D.	21
Comments, Michael Nichol, Ph.D.	31
Comments, Robert Seidman, Pharm.D.	38
Questions from the Committee to Blue Cross	40
Response to Petition:	
By Aventis, Francois Nader, M.D.	64
By Schering Plough, Robert Spiegel, M.D.	81
Open Public Hearing - Allergists:	
Eric Schenkel, M.D., Valley Allergy and Asthma Treatment Center	100
Ivor Emanuel, M.D., University of California, San Francisco	104
Daniel Hussar, Ph.D., Philadelphia College of Pharmacy	109
Dr. Frank Brocato, Employers Health Coalition	114
Mark Cloutier, MPH, MPP, RxHealthValue	117
Michael Parker, M.D., AAOA	120
J.A. Quel, M.D., HAAMA	125
FDA Presentation:	
OTC Considerations, Cazemiro Martin	130
Clinical Safety Overview, Robert Meyer, M.D.	141
Questions from the Committee to the FDA	171
Open Public Hearing:	
Professional Associations:	
Bobby Lanier, M.D. AAAA	186
Michael Kaliner, Institute for Asthma and Allergy	192

C O N T E N T S (Continued)

Patient Advocacy:

Nancy Sander, Allergy and Asthma Network	
Mothers of Asthmatics	197
Richard Carson, AAFA	202

Health Consultants:

Bryan Luce, Ph.D., MEDTAP International	204
Joel W. Hay, Ph.D.	209
Steve Francesco, Francesco International	215

Trade Organizations:

Bert Spilker, M.D., PhRMA	222

Final Questions	286
-----------------	-----

P R O C E E D I N G S

Call to Order and Introductions

DR. BRASS: I am going to go ahead and begin the meeting. I am Eric Brass, from Harbor-UCLA Medical Center and Chair of the Nonprescription Drugs Advisory Committee.

Before we begin the official business today, I think we have a large panel and I would just like to go around and allow everybody to introduce themselves. The microphones require you to depress the "speak" button to be heard. Please do not speak without a microphone, and please be sure to turn your microphone off afterwards or we will hear your side bars. George, if you could begin the introductions, please?

DR. BLEWITT: Yes, I am George Blewitt. I am the industry liaison representative for the Nonprescription Drugs Advisory Committee.

DR. BARAINUK: Jim Barainuk, pulmonologist at Georgetown, from the Allergy Pulmonary Committee.

MS. CONNER: I am Brenda Conner. I am the consumer representative to the pulmonary and allergy committee.

DR. KRENZELOK: I am Ed Krenzelok. I am

1 Director of the Pittsburgh Poison Center and
2 Professor of Pharmacy and Pediatrics at the
3 University of Pittsburgh.

4 DR. VOLLMER: I am Bill Vollmer. I am a
5 statistician and epidemiologist with the Kaiser
6 Permanente Center for Health Research in Portland,
7 Oregon.

8 DR. GILLIAM: I am Edwin Gilliam, a nurse
9 practitioner from Tucson, Arizona and on the NDAC
10 committee.

11 DR. APTER: I am Andrea Apter, University
12 of Pennsylvania. I am an allergy immunologist and
13 I am on the pulmonary allergy committee.

14 DR. PATTEN: I am Sonia Patten. I am from
15 Minneapolis, Minnesota and I am a consumer
16 representative of the Nonprescription Drugs
17 Advisory Committee.

18 DR. WOOD: I am Alastair Wood. I am a
19 clinical pharmacologist from Vanderbilt University
20 in Nashville, Tennessee.

21 DR. RODEN: I am Dan Roden. I am a
22 clinical pharmacologist from Nashville, Tennessee.

23 DR. JOAD: I am Jesse Joad. I am a
24 pediatric pulmonologist and allergist at the
25 University of California, Davis and I am on the

1 pulmonary allergy committee.

2 DR. KELLY: Bill Kelly, University of New
3 Mexico, Department of Pediatrics, clinical
4 pharmacist.

5 DR. JOHNSON: I am Julie Johnson. I am
6 from the University of Florida College of Pharmacy
7 and Cardiovascular Medicine, and I am on NDAC.

8 DR. TITUS: I am Sandy Titus. I am the
9 executive secretary for NDAC and I did this meeting
10 jointly with the executive secretary for pulmonary
11 allergy who is Camilla Topper.

12 DR. UDEN: I am Don Uden, University of
13 Minnesota, member of NDAC.

14 DR. D'AGOSTINO: Ralph D'Agostino,
15 biostatistician from Boston University, consultant
16 to NDAC.

17 DR. DYKEWICZ: Mark Dykewicz, in the
18 Division of Allergy and Immunology at St. Louis
19 University School of Medicine, a member of
20 Pulmonary and Allergy Drugs Advisory Committee.

21 DR. NEILL: I am Richard Neill, a family
22 physician in the Department of Family Practice and
23 Community Medicine from the University of
24 Pennsylvania.

25 DR. FINK: I am Bob Fink, George

1 Washington University in Washington, D.C., and a
2 pediatric pulmonologist at Children's National
3 Medical Center.

4 DR. WILLIAMS: I am Henry Williams, Howard
5 University and member of NDAC.

6 DR. LAM: I am Francis Lam, from the
7 University of Texas Health Science Center in San
8 Antonio, Department of Pharmacology and Medicine.
9 I am a member of NDAC.

10 DR. NIEDERMAN: I am Michael Niederman,
11 Pulmonary and Critical Care at Winthrop Hospital in
12 Mineola, New York, and I am on the faculty of State
13 University of New York at Stonybrook, and I am on
14 the Pulmonary and Allergy Advisory Committee.

15 DR. CLAPP: I am Leslie Clapp,
16 pediatrician, Main Pediatrics in Buffalo, New York,
17 and Clinical Associate Professor of Pediatrics at
18 State University of New York at Buffalo.

19 DR. GANLEY: I am Charlie Ganley, the
20 Director of the Division of Over-the-Counter Drugs
21 at FDA.

22 DR. MEYER: I am Bob Meyer. I am the
23 Director of the Division of Pulmonary Allergy Drugs
24 at FDA.

25 DR. JENKINS: I am John Jenkins. I am the

1 Director of the Office of Drug Evaluation II, FDA.

2 DR. KWEDER: I am Sandra Kweder, FDA.

3 DR. BRASS: Thank you. I will now ask Dr.
4 Titus to read today's conflict of interest
5 statement.

6 **Conflict of Interest Statement**

7 DR. TITUS: The following announcement
8 addresses the issue of conflict of interest with
9 regard to this meeting and is made a part of the
10 record to preclude even the appearance of such at
11 this meeting.

12 Based on the submitted agenda for the
13 meeting and all financial interests reported by the
14 committee participants, it has been determined that
15 all interests in firms regulated by the Center for
16 Drug Evaluation and Research present no potential
17 for an appearance of conflict of interest at this
18 meeting, with the following exceptions. In
19 accordance with 18 USC 208(b), full waivers have
20 been granted to Dr. Ralph D'Agostino, Dr. Eric
21 Brass, Dr. Hari Sachs, Dr. William Kelly, Dr.
22 Andrea Apter, Dr. Michael Niederman and Dr. Dan
23 Roden.

24 In addition, a limited waiver has been
25 granted to Dr. James Barainuk which allows him to

1 participate in the discussions without voting. A
2 copy of the waiver statements may be obtained by
3 submitting a written request to the agency's
4 Freedom of Information Office, Room 12A-30 of the
5 Parklawn Building.

6 In addition, we would like to disclose for
7 the record that Drs. Lam, Sachs, Dykewicz, Barainuk
8 and Williams and Michael Niederman have interests
9 which do not constitute a financial interest within
10 the meaning of 18 USC 208(a) but which could create
11 the appearance of a conflict. The agency has
12 determined, notwithstanding these interests, that
13 the interest of the government in their
14 participation outweighs the concern that the
15 integrity of the agency's programs and operations
16 may be questioned. Therefore, Drs. Lam, Sachs,
17 Dykewicz, Barainuk and Niederman may participate
18 fully in today's discussions.

19 In the event that the discussions involve
20 any other products or firms not already on the
21 agenda for which an FDA participant has a financial
22 interest, the participants are aware of the need to
23 exclude themselves from such involvement and their
24 exclusion will be noted for the record.

25 With regard to all other participants, we

1 ask in the interest of fairness that they address
2 any current or previous financial involvement with
3 any firm whose products they may wish to comment
4 upon.

5 DR. BRASS: Thank you very much. I will
6 now ask Dr. Ganley, from the FDA, to give us our
7 introduction for today's session.

8 **Welcome and Introduction to Today's Issues**

9 [Slide]

10 DR. GANLEY: I would just like to welcome
11 everyone to the meeting today. Before introducing
12 the topic for discussion today, I would just like
13 to thank the members of the Nonprescription Drugs
14 and Pulmonary Drugs Advisory Committees for taking
15 the time from their busy schedules to participate
16 in today's discussion.

17 I would also like to acknowledge the work
18 of the staff at the FDA involved in the review of
19 material related to the issue for discussion today,
20 and the advisers and consultant staff at the FDA
21 for their efforts in organizing this meeting.

22 [Slide]

23 Today's meeting will discuss issues raised
24 in a citizen petition. For those of you who are
25 unfamiliar with this process, the regulations for

1 citizen petitions are covered in Title 21 of the
2 Code of Federal Regulations, Part 10, specifically
3 Section 10.30. Simply stated, it request that the
4 Commissioner of FDA takes some action.

5 The other important thing to understand
6 with regard to citizen petitions is that they are
7 submitted to a public docket. Anyone can read them
8 and, if they choose, submit comments to the docket
9 relevant to the petition. These comments will be
10 taken into consideration during the review of the
11 petition.

12 In reviewing the petition, the
13 Commissioner may hold a hearing, such as the
14 advisory committee meeting being held today. It
15 can also convene meetings, conferences and
16 discussions with persons outside the agency,
17 propose to issue, amend or revoke regulations;
18 publish a Federal Register Notice requesting
19 information, and participate in other public
20 proceedings about the issue.

21 Citizen petitions raising issues related
22 to the marketing of OTC products are not unique.
23 They more commonly involve products that would be
24 marketed under the OTC monographs and have been
25 discussed at public meetings in the past. This

1 petition is somewhat unique in that it deals with
2 products that are marketed under new drug
3 applications.

4 [Slide]

5 Today's meeting will focus on an issue
6 raised in a citizen petition submitted by Robert
7 Seidman on behalf of Blue Cross of California.
8 The petition was dated July 21, 1998. There have
9 been subsequent amendments by the petitioner to
10 this petition. The most recent amendment by the
11 petitioner was submitted in October of 2000.

12 The petition requests that the agency
13 convert the five prescription
14 antihistamine-containing drug products listed here
15 to OTC marketing.

16 [Slide]

17 I would like to address the areas that we
18 hope will be the focus of discussion and which will
19 be the focus of the presentation by the FDA. The
20 first involves the OTC marketing of antihistamines
21 as OTC drug products. Cazemiro Martin, from the
22 Division of Over-the-Counter Drug Products, will
23 provide an overview of antihistamines in the OTC
24 drug review and how this category of drug products
25 has been generally recognized as safe and effective

1 under its conditions of use.

2 The second is the safety profile of these
3 products. Robert Meyer, from the Division of
4 Pulmonary Drug Products, will present the FDA
5 review and the safety of these procedures.

6 [Slide]

7 There are four areas that the agency hopes
8 will not become the focus of discussion by the
9 committee. This, however, does not preclude any of
10 the presenters from raising these issues in their
11 presentations. The chair of this advisory
12 committee will have the discretion to limit
13 discussion of these issues by the committee.

14 The agency acknowledges that all the
15 products have data in their NDAs to support
16 efficacy. So, there is no need to go into detailed
17 presentation or discussion of efficacy of these
18 products.

19 Secondly, there is no need to discuss the
20 legal authority of FDA to initiate a prescription
21 to OTC switch. We are bringing this issue before
22 the committee for their scientific expertise and
23 not for their legal expertise.

24 Third, a switch from Rx to OTC status will
25 not impact on any existing patents and exclusivity

1 remaining for these products. Consequently, there
2 is no need to discuss this.

3 Lastly, with regard to the issue of cost
4 of therapy and health insurer reimbursement, in
5 making decisions on the approval of drug products
6 for prescription or OTC marketing drug cost or
7 reimbursement by health insurers are not factors in
8 the agency's decisions. The agency does not have
9 the regulatory authority to control the cost or
10 health insurer reimbursement of drug products. The
11 agency will base any decision on the merits of the
12 scientific data for the individual drug products
13 and will proceed under the mechanisms permitted by
14 the regulations. Clearly, both the petitioner and
15 the drug manufacturer control cost and
16 reimbursement, and both have a secondary gain in
17 favoring one outcome over the other.

18 [Slide]

19 Finally, the suitability of OTC marketing
20 of Claritin, Allegra and Zyrtec should be based on
21 their individual merits. The committee should
22 consider them individually and not necessarily as a
23 group. Secondly, relative comparisons of safety
24 and efficacy to the currently marketed OTC
25 antihistamines are not necessary.

1 I would just like to make one additional
2 comment. Under the conditions of use the currently
3 marketed OTC antihistamine products have been
4 classified as generally recognized as safe and
5 effective in the OTC antihistamine monograph, or
6 they are marketed under approved new drug
7 applications. In their petition, the Blue Cross of
8 California has characterized the currently marketed
9 antihistamines as dangerous but they have not
10 provided data to support this characterization.

11 With that, I conclude my introduction and
12 the agency looks forward to the discussion and
13 recommendations of the committee.

14 DR. BRASS: Thank you very much, Dr.
15 Ganley. At this time, I would like to turn the
16 podium over to Dr. Seidman, from WellPoint Health
17 Networks, to present the citizen's petition.

18 **Blue Cross Petition**

19 DR. SEIDMAN: Good morning, everyone.

20 [Slide]

21 I am honored and humbled to be here. In
22 support of our petition this morning, I have Dr.
23 Robert Crocker, who is Senior Vice President of
24 Clinical Affairs for WellPoint Health Networks, and
25 Dr. Mike Nichol and Dr. Jack Kern from the

1 University of Southern California School of
2 Pharmacy.

3 [Slide]

4 Why am I here today? That is an
5 incredible question. I wrote a letter; I am here
6 today to ask the advisory panel to do something
7 that is in the best interest of the American
8 people. I am asking that you make a recommendation
9 to the Food and Drug Administration to convert
10 Claritin, Allegra and Zyrtec from prescription to
11 over-the-counter status.

12 [Slide]

13 We filed our petition because we believe
14 that Claritin, Allegra and Zyrtec lack any
15 significant criteria that would require the Food
16 and Drug Administration to maintain these drugs as
17 prescription drugs. You can see the criteria that
18 we filed this under. We believe that the Food and
19 Drug Administration's jurisdiction in this area is
20 clear.

21 [Slide]

22 This has been a long and what I hope to be
23 a productive journey. We have a unique opportunity
24 today to obtain input from this country's experts
25 on these drugs and get a decision on this important

1 issue.

2 [Slide]

3 It is my hope that when all is said and
4 done today the advisory committee will make a
5 recommendation to the Food and Drug Administration
6 to convert these incredibly safe and effective
7 drugs to over-the-counter status.

8 [Slide]

9 Why did we submit this petition? This
10 week it feels as if everyone on the planet has been
11 asking me this question. Americans are seeking
12 greater oversight over their health care. The
13 over-the-counter status of these drugs will be more
14 convenient for allergy sufferers. Allergy
15 sufferers know how to use antihistamines, and
16 precedent has already been set that antihistamines
17 can be used effectively in the over-the-counter
18 market. These drugs are safer than the
19 over-the-counter antihistamines that are available
20 today.

21 [Slide]

22 I have only one slide on pharmacy costs
23 and I will be brief. The current increases in
24 prescription drug costs are unaffordable and
25 unsustainable. There are forty million Americans

1 who lack any health insurance. There are
2 twenty-five million senior citizens who have no
3 prescription drug coverage. Maintaining Claritin,
4 Allegra and Zyrtec as prescription drugs does not
5 protect the public health and is a major burden on
6 the healthcare system, both public and private.

7 [Slide]

8 Why are these drugs prescription? The
9 presumption under Durham-Humphrey is that all drugs
10 are over-the-counter unless professional guidance
11 is required. There is no credible clinical reason
12 for Claritin, Allegra and Zyrtec to be maintained
13 as prescription drugs. If the Commissioner
14 believes that the prescription drug status for
15 these drugs is not necessary to protect the public
16 health they should be available over-the-counter.

17 [Slide]

18 We believe that the second-generation
19 antihistamines meet the criteria for an OTC switch.
20 The questions that we need to ask are can the
21 condition be adequately self-diagnosed? Can the
22 condition be successfully self-treated -- all of
23 this in an over-the-counter environment? Is the
24 self-treatment product safe and effective for
25 consumer use and conditions of actual use?

1 We know, because of the precedent of many
2 over-the-counter antihistamines being available
3 today, that patients can readily diagnose their
4 condition; that patients can successfully
5 self-treat; that patients can use these safely in
6 an over-the-counter environment.

7 These drugs are available over-the-counter
8 in many countries, and we have brought along a
9 visual aid to show the over-the-counter packaging
10 that is available. Claritin has been available
11 over-the-counter in Canada for twelve years with an
12 exemplary safety record. Using the FDA's own
13 criteria, these drugs should be truly
14 over-the-counter, not the virtual over-the-counter
15 drugs that they are today.

16 [Slide]

17 The forty million allergy sufferers in our
18 country deserve ready and easy access to these
19 safer drugs. The majority of allergy sufferers can
20 recognize their symptoms. These drugs have less
21 side effects than the current OTC drugs that are
22 available today. They have side effects similar to
23 a sugar pill.

24 I would like to now introduce Dr. Jack
25 Kern, who will summarize the findings of an

1 evidence-based report comparing the safety and
2 efficacy of first and second-generation
3 antihistamines. He will be followed by Dr. Mike
4 Nichol, who will review data on his quality
5 adjusted life year study. The evidence-based study
6 was funded by WellPoint Health Networks. The
7 quality study was an independent venture of Dr.
8 Mike Nichol. At the conclusion of their comments I
9 will summarize. Thank you.

10 **Comments by Jack Kern, Pharm.D.**

11 DR. KERN: We were involved with this
12 evidence-based project and, like all the
13 evidence-based projects I have been involved with,
14 it is an interesting approach to evaluating the
15 literature to come up with a policy. We put
16 together a team involving a research librarian and
17 we identified approximately 289 titles that are
18 involved with randomized, controlled studies of the
19 first-generation and second-generation
20 antihistamines. We screened these titles looking
21 primarily for the studies having to do with the
22 treatment of seasonal allergic rhinitis and
23 perennial allergic rhinitis involved with drugs
24 first generation and second generation,
25 first-generation drugs being the diphenhydramine

1 and chlorpheniramine; the second-generation drugs
2 being the fexofenadine, loratadine and cetirizine.

3 Of these studies, we reduced it down to
4 95, photo copied the articles, went to through them
5 in a considerable amount of detail, and then we
6 finally settled on 36 of the studies for our
7 evidence-based report. These 36 randomized,
8 controlled studies made up the basis for our
9 meta-analysis.

10 Of interest, these populations that we
11 focused on also reflect the OTC population. This
12 is the primary indication of seasonal allergic
13 rhinitis and perennial allergic rhinitis. We had
14 several reviewers so it wasn't done just by one
15 person screening these particular articles, and
16 these references serves as the basis for our
17 evidence tables.

18 One of the most important components of
19 the evidence tables are the safety factors that
20 have an impact on the outcome for the use of these
21 particular drugs, and these significant factors
22 have to do with the source of the antigens -- is it
23 natural, environmental; having to do with pollen
24 counts; having to do with the pollen source; having
25 to do with the symptom scores, what kind of a

1 scoring system was used to evaluate the outcomes
2 for these studies, whether they involved nasal
3 congestion; and the duration of the observational
4 period of time, was it one day, five days, or was
5 it over a period of forty days?

6 The evaluator for the outcome was
7 importantly screened for whether it was evaluated
8 by the patient, by the physician or a combination
9 of both, and also whether there was a period of
10 lead-in time to evaluate whether patients actually
11 had allergic rhinitis.

12 Based upon these findings in the evidence
13 tables, we built our shrinkage plots, and this was
14 in conjunction with a statistician. Then, after
15 development of the shrinkage plots we developed our
16 conclusions, had discussions and tried to
17 understand why various studies had different
18 outcomes. There is quite a bit of variance in this
19 particular disease state so you would expect to see
20 that all the studies wouldn't necessarily line up
21 in terms of one number for efficacy.

22 [Slide]

23 Having to do with the efficacy of these
24 studies, what we wanted to do was we wanted to take
25 a look at the 36 studies and then begin to boil

1 them down one step further as to which studies we
2 were going to pool together. We looked at the
3 dose. The dose of the studies had to be the same.
4 All of the studies had to be blinded because the
5 nature of the outcome evaluation for seasonal
6 allergic rhinitis is subjective, that is the
7 primary endpoint. Then, the scoring system had to
8 be the same. There are several different scoring
9 systems. We wanted the system and the point scores
10 that were given to be similar between these. And,
11 out of the 36 we identified 28 studies that were
12 compatible to be able to combine the studies for
13 the different drugs.

14 For example, for loratadine one of the
15 studies had to do with perennial allergic rhinitis;
16 the remaining studies were of seasonal allergic
17 rhinitis. This may sound like you are mixing
18 apples and oranges but, in fact, in the general
19 public this is what we were trying to mimic, the
20 use of the drug in the society where you may expect
21 the OTC population. They wouldn't all be just one
22 particular group; they would be varied. This would
23 also create a larger variance in our overall
24 evidence report and not try minimize it to just get
25 the maximum number but try to get a more realistic

1 assessment. The duration within the loratadine
2 studies varied quite a bit from just one dose over
3 a five-hour period in an experimental chamber where
4 the patients were exposed to a high dose of pollens
5 as compared to the remaining studies which were in
6 the natural environment.

7 In this disease of seasonal allergic
8 rhinitis there are typically five different
9 antigens that are associated with allergic
10 rhinitis, and these have to do with pollens, mites;
11 having to do with molds, animals and having to do
12 also with insects. Patient sensitivity to these
13 different pollens is quite considerable so there is
14 a tremendous amount of variation in how a group of
15 patients will respond to these drugs. Also, over
16 the course of time patients' sensitivities to these
17 particular antigens change. So, there is a lot of
18 variance in terms of a given response.

19 The outcome we looked at in this case had
20 to do with global efficacy, and we considered a
21 positive response if patients were asymptomatic or
22 markedly symptomatic [sic] so that they would be
23 able to function normally in their daily life.

24 As we see in these studies with
25 cetirizine, we identified seven studies and the

1 overall effect size was a reduction of the
2 symptomatology by 24 percent. With loratadine the
3 reduction was 21 percent; and with cetirizine in
4 children there was a similar reduction of 26
5 percent. Cetirizine compared to loratadine -- we
6 had a head-to-head evaluation between these two and
7 it appears that perhaps cetirizine may be a bit
8 more effective than loratadine.

9 Of significance was taking a look at the
10 comparison between first-generation and
11 second-generation antihistamines, and this was
12 between chlorpheniramine and terfenadine.
13 Terfenadine, as of 1998, was removed from the
14 market in the United States but it is a
15 second-generation antihistamine and it is a
16 situation where we had a head-to-head evaluation of
17 the efficacy between these two.

18 Of interest, in an evidence-based report
19 you are not allowed to generate data. You are
20 allowed to evaluate what data exists. That was the
21 reason why we selected those particular two,
22 showing that, in fact, second-generation
23 antihistamines are equivalent in terms of efficacy
24 to the first generation.

25 [Slide]

1 Having to do with the side effects of the
2 first-generation and second-generation
3 antihistamines, the side effect issue is the main
4 difference between these two particular drug
5 products, and we identified 29 of the studies of
6 the 36 that gave us information as to whether the
7 patients complained of these particular side
8 effects or not. We see with the chlorpheniramine
9 that the incidence of sedation was approximately 17
10 percent, and then in adults and children with
11 cetirizine it was the same, about a third of what
12 it was with the chlorpheniramine of 5-6 percent.
13 With loratadine, of 11 studies the overall
14 incidence was zero. It was not any different than
15 compared to placebo. With fexofenadine, there were
16 5 studies that we identified with fexofenadine and
17 4 of them did not give us any report on sedation or
18 did not report that sedation was a complaint that
19 the patients had while they were receiving that
20 particular drug.

21 So, we see once again that based upon this
22 significant distinction between these particular
23 groups of drugs that the sedation profile had a
24 much higher incidence in the first-generation than
25 the second-generation antihistamines.

1 [Slide]

2 In conclusion, the quality of these
3 studies is high. They are randomized, controlled
4 studies. They were all blinded. They had to be in
5 order to evaluate the particular outcomes for these
6 studies. The population is similar to what would
7 be seen in the OTC population. And, we see a
8 similar effect between the first generation and
9 second generation of approximately one in four, one
10 in five patients having a very good response to
11 these particular drugs.

12 You may also ask, well, what about the
13 other 80 percent, 75 percent -- yes, there is
14 considerable amount of variation in terms of
15 response to these participant diseases and this
16 begins to set up a situation. In 1998 there was a
17 major joint task force of three of the allergic
18 societies in the United States. They came together
19 to put together a consensus report on the diagnosis
20 of treatment of rhinitis, and their general
21 consensus was that the most appropriate use of an
22 consultation with an allergist was in patients that
23 failed first-line therapy for the treatment of
24 allergic rhinitis, which is typically having to do
25 with antihistamines.

1 So, their conclusion in terms of the issue
2 of efficacy is that the first-generation and
3 second-generation antihistamines are equivalent.
4 The difference between the two with regard to
5 sedation -- the idea of sedation is significant but
6 where it really begins to be important is having to
7 do with performance.

8 The Federal Aviation Administration has
9 come to the conclusion that the second-generation
10 antihistamines are safe and effective for pilots to
11 use while flying if they do not experience any
12 symptoms of sedation while receiving the
13 second-generation antihistamines, whereas with the
14 first-generation antihistamines it is not
15 appropriate for pilots to use these drugs while on
16 duty.

17 There have been studies evaluating the use
18 of these two groups of drugs with regard to
19 driving, and the conclusion is that the
20 first-generation antihistamines produce a sedative
21 performance compromising the drivers, equivalent to
22 0.05, 0.08 equivalence with ethanol, and that the
23 impairment of driving by the second-generation
24 antihistamines is minimal to none.

25 Having to do with the cardiovascular

1 toxicity of these particular products, there have
2 been a major epidemiological studies that have
3 looked at these particular drugs and have found
4 that the first-generation antihistamines are
5 associated with a significant incidence of serious
6 cardiac abnormalities, arrhythmias, as opposed to
7 the second generation which have not. This is
8 where the incidence with terfenadine became of
9 interest in that terfenadine in combination with
10 drugs that inhibit its metabolism and that subgroup
11 the incidence of serious cardiac abnormalities was
12 identified and, therefore, the drug was removed.

13 With regard to loratadine, the drug has
14 multiple sites of elimination so this particular
15 drug interaction is not as significant. Cetirizine
16 is primarily eliminated renally, compromising its
17 ability to be metabolized and eliminated and does
18 not have a significant effect on cardiac toxicity.

19 Fexofenadine, and it is the active
20 metabolite of terfenadine, has been given in very
21 high doses, ten times above the usual and ordinary
22 dose, and cardiac dysrhythmias have not been
23 identified with that particular drug.

24 So, at this time the evidence is quite
25 supportive of a conclusion that the two groups of

1 drugs are equivalent from an efficacy point of
2 view, and that the second benzodiazepine
3 antihistamines are safer and, therefore, should be
4 available for people to use for treatment of their
5 seasonal allergic rhinitis, perennial allergic
6 rhinitis. With that I conclude.

7 **Comments by Michael Nichol, Ph.D.**

8 DR. NICHOL: Thank you very much, Jack.
9 It is a pleasure to be here this morning and I
10 would like to just point out a couple of things
11 prior to exploring some of the issues related to
12 our cost-effectiveness model.

13 First of all, as Rob indicated, this
14 research was internally funded at the University of
15 Southern California. This has not been supported
16 by any insurers nor any pharmaceutical company.
17 The second thing is that this model has not been
18 peer reviewed at this time. So, consequently, I
19 look at this as an opportunity for us to get some
20 comments back from you as well as others prior to
21 going through the peer review process and
22 publication process.

23 [Slide]

24 So, why are we motivated to look at the
25 cost effectiveness associated with an Rx-OTC

1 switch? Obviously, as Prof. Kern has already
2 discussed, the meta-analysis that was recently
3 completed points out that there are some very
4 important differences with regard to some of the
5 sedation side effects and, consequently, Patrick
6 Sullivan, a doctoral candidate in our program, and
7 I embarked on the idea of looking at what the cost
8 effectiveness may be with regard to that sedation.

9 So, the study purpose that we had was to
10 identify the assumptions of a cost-effectiveness
11 model and also vary some of those assumptions to
12 see whether or not there are some key issues that
13 we need to resolve. The model that we have is a
14 decision analytic model. The perspective is
15 societal to the extent that we can within the data
16 that are available. The period of analysis that we
17 have is just one year. Our cohort is the adult
18 population in the United States, actually the
19 driving population in the United States. And, the
20 comparison, the specific comparison that we made is
21 the prescription loratadine versus over-the-counter
22 loratadine, primarily because, as Dr. Kern
23 indicated, the studies that are available make
24 direct comparisons between some of the
25 first-generation antihistamines and loratadine.

1 The impact that we modeled was on motor
2 vehicle accidents -- the effects of sedation on
3 motor vehicle accidents. Redelmeir and Weinstein,
4 in a piece that was done not long ago in Medical
5 Decision-Making, looked at the effect of cell phone
6 utilization on motor vehicle accidents and had a
7 very nice model that we could adapt with regard to
8 sedation. The output in this particular model is
9 cost per quality-adjusted life year.

10 [Slide]

11 The incremental cost-effectiveness ratio
12 for this particular model shows that there is a
13 cost saving to society of approximately 62,000
14 dollars per quality-adjusted life year. Those of
15 you that have looked at cost-effectiveness analyses
16 before recognize that this is a fairly remarkable
17 finding given the fact that in the United States we
18 generally adopt innovations that cost society about
19 50,000 dollars per quality-adjusted life year.

20 Well, what is the source of the savings
21 that accrue from this particular model? When we
22 looked at the base case, what we did was we used,
23 as I indicated, a model that was developed by
24 Redelmeir and Weinstein with regard to the effects
25 of collisions. In terms of the relative risk of

1 sedation, there are four different studies that
2 point out, as Prof. Kern indicated, that the effect
3 of sedation is roughly similar to being legally
4 intoxicated behind the wheel.

5 In terms of the risk of fatality and the
6 risk of injury, that was deduced from material that
7 was provided by the National Highway Traffic Safety
8 Administration. With regard to the percent of
9 patients that are being treated by physicians, that
10 was derived from the literature, an article by
11 Malone in Allergy and Clinical Immunology. Then,
12 we made two very important assumptions, I think.
13 They may not be as important as you might think
14 from the beginning when we started to look at this
15 model, and that is that we assumed that given there
16 was an M.D. visit, the proportion of the market
17 that would be given to the second-generation
18 antihistamines, we estimated that the base case
19 that that would be 80 percent, and then what would
20 happen once these medications might be transitioned
21 to an OTC market we were assuming a 50 percent
22 market share on that.

23 [Slide]

24 We find that there is a dominating
25 solution, and in this case with the cost-savings

1 effects there is clearly a dominating solution. We
2 may conclude, consequently, that it is not
3 necessary to do any additional analyses. However,
4 in this case it may be very useful for us to look
5 at what some of the key issues are that may drive
6 this type of a decision.

7 [Slide]

8 In this case we applied a sensitivity
9 analysis and looked at the percent drop in the
10 non-sedating price after an OTC conversion. Our
11 base case anticipated that the price would actually
12 drop by about 66 percent. Again, this was modeled
13 off literature on the H-2s, the GI-related
14 medications, because after they went
15 over-the-counter there was a drop in price of about
16 66 percent. So, we can obviously say, well, maybe
17 it is not going to drop that severely and, at this
18 point, what this shows is that, using our base case
19 scenario, if the prices only drop 27.5 percent this
20 would still be a cost-effective innovation with
21 regard to American society.

22 Note also here that we are assuming that
23 the OTC present first-generation antihistamines are
24 also going to be dropping 66 percent. If, in fact,
25 those prices do not change what happens is that it

1 turns out that it is still a much more
2 cost-effective solution. That is, the prices for
3 the second generation, as they convert to OTC,
4 could drop as little as 10 percent and it would
5 still be cost effective.

6 One of the other key issues is the
7 percentage of the population with allergic rhinitis
8 that is being treated by M.D.s. As you can see
9 with this particular slide, our base case was 12
10 percent. This was based on the literature that we
11 had available at the time. As you can see, if we
12 increase that proportion, that is, if we decide
13 that, in fact, maybe 25 percent of the people are
14 being treated with allergic rhinitis you can see
15 that it becomes even more cost effective as we move
16 through this particular analysis.

17 [Slide]

18 So, our preliminary analysis indicates
19 that in this case the conversion from Rx to OTC
20 would actually be cost saving to society. One of
21 the things that I think is very important for us to
22 realize is that we are anticipating this analysis
23 is what we would call a zero-sum gain. We are not
24 anticipating that the market is going to expand.
25 We clearly need to do some work with regard to

1 modeling the effects on both price and also the
2 elasticity of demand, and that is some of the work
3 that we will be doing subsequent to this.

4 Another issue that was raised in a
5 briefing paper by Schering Plough was the impact
6 that this might have in terms of the inappropriate
7 use by consumers. As we indicate here, there are a
8 number of issues that you may need to consider when
9 you try to model that inappropriate use. However,
10 with this model one thing that would can do is look
11 at how bad would the inappropriate use have to be
12 for this type of conversion to not be cost
13 effective.

14 In our modeling, it appears to us that in
15 this case 100 percent of the patients that are
16 being presently treated with prescription
17 medications could incur an additional 150 dollars
18 on average in a year and the conversion would still
19 be cost effective. That means that we are talking
20 about an additional two or three offsets for 100
21 percent of that prescription population. On the
22 other hand, 13 percent of that population could
23 incur up to 2500 dollars in hospitalization costs
24 and this innovation would still be cost effective.

25 So, in conclusion, it appears to us that

1 there are some significant issues with regard to
2 the cost effectiveness associated with these
3 medications. The superior safety profile and the
4 non-sedation effects are very important with regard
5 to cost-effectiveness analysis. And, I appreciate
6 your attention.

7 **Comments by Robert Seidman, Pharm.D.**

8 DR. SEIDMAN: Thank you, Dr. Kern and Dr.
9 Nichol for presenting the science.

10 [Slide]

11 Briefly, our petition is being portrayed
12 as being unprecedented but in reality it is not.
13 In 1982 the Food and Drug Administration converted
14 Alupent from prescription to over-the-counter
15 status, and the FDA's authority in making these
16 decisions is absolutely clear.

17 [Slide]

18 Let's talk a little bit about the public
19 interest. These products meet all requirements for
20 over-the-counter status. There is a long history
21 of over-the-counter marketing of antihistamines in
22 this country. These drugs are effective and safe.
23 As we have heard, they have a low incidence of side
24 effects and are equally effective. Switching these
25 products to over-the-counter status will make safer

1 products accessible to the public. Converting the
2 second-generation antihistamines to
3 over-the-counter status is in the public's
4 interest. Society deserves open and easy access to
5 these incredibly safe and effective drugs.

6 [Slide]

7 When I was here last June I was asked for
8 comments on prospective over-the-counter labeling
9 for Claritin, Allegra and Zyrtec. Looking at some
10 of the labeling that we have in the country today
11 for over-the-counter antihistamines and stealing a
12 little information from some of the Canadian
13 labeling, we have some draft labeling that can
14 easily fit on a box to help the 40 million allergy
15 sufferers in our country to take greater control of
16 their allergies.

17 I have also brought some samples that are
18 velcro'd to the board. I encourage anyone in the
19 room to please come and look at these. Please
20 return them when you are done because they are not
21 allowed to be sold in this country at this time.
22 As you can see, the OTC labeling is safe and
23 allergy sufferers will be able to understand and
24 self-treat where appropriate.

25 [Slide]

1 This has been a long and I hope a
2 productive journey. The questions asked today help
3 firmly position Food and Drug Administration in the
4 role that society expects, providing broad access
5 to safe drugs. We would like the advisory
6 committee today to vote and make a recommendation
7 to the Food and Drug Administration to allow
8 Claritin, Allegra and Zyrtec to be sold
9 over-the-counter to benefit the allergy sufferers
10 in our great nation. We also expect the
11 pharmaceutical industry to abide by whatever
12 decision is rendered by the Food and Drug
13 Administration. This healthy debate has helped all
14 Americans. Thank you very much.

15 **Questions from the Committee to Blue Cross**

16 DR. BRASS: Thank you. At this time, we
17 have a period where the panel can ask questions of
18 petitioner. Before we begin that, I ask the panel
19 to remember the introduction presented by Dr.
20 Ganley with respect to the scope of the questions,
21 and that we will have subsequent presentations by
22 two of the current manufacturers as well as the FDA
23 providing more detail. Given that, if there are
24 questions for the petitioner from the panel -- yes,
25 Ralph?

1 DR. D'AGOSTINO: I understand what was
2 said about the focus of the committee
3 deliberations, but I would like to ask just a
4 couple of questions in terms of the meta-analysis
5 and then a couple of other questions.

6 The decision analysis has not been peer
7 reviewed. Has the meta-analysis been peer
8 reviewed?

9 DR. KERN: No, it has not been peer
10 reviewed at this time.

11 DR. D'AGOSTINO: There is a large number
12 of studies that were potential and then a small
13 number of studies analyzed. Let me just go on. I
14 am a great advocate of antihistamines, at least the
15 first generation, being put in OTC medication
16 packages for common colds and so forth. Is the
17 notion of the second generation that they would, in
18 terms of this replacement -- and, you know, what
19 would be the level of first generation -- that they
20 would take the place of first generation? I mean,
21 I am interested in how the safety and the use of
22 the actual second generation will play itself out
23 with the OTC, and one possible use is that people
24 will start taking it for their runny nose as they
25 catch a cold.

1 The other is the drug interactions. I am
2 not sure that we understand all the drug
3 interactions that the second generation have and I
4 just want to get a sense of what the petitioner is
5 actually saying about those. Are we ready to just
6 go straight OTC?

7 DR. KERN: I think that is an interesting
8 issue as to whether the first generation should be
9 dropped. I don't think so at this time for the
10 reason, as I mentioned, that in the whole picture
11 of this seasonal allergic rhinitis there is a lot
12 variance in the population, and patients and people
13 who are having a positive response to the first
14 generation, I don't think they should be denied
15 access to that drug. The typical recommendation in
16 the allergic community is the allergist is to start
17 with a second-generation antihistamine. In the
18 situation where it appears that it may be of
19 benefit to move to first, there may be those
20 occasions to do that and that would probably be the
21 exception by far. The topical use of inhaled
22 steroids is probably the most effective drug that
23 you can use.

24 So, there are several options that can be
25 used, but in terms of your question about dropping

1 at this point, probably not because there are
2 people who are responding to this drug. The other
3 side that does make me feel uncomfortable about the
4 idea of not dropping it is that many people that
5 feel that they don't have any symptoms of sedation,
6 when they are tested in terms of their driving
7 performance, they are compromised. So, there needs
8 to be some debate about that as to what the
9 consequences are of individuals that feel that they
10 are not having any adverse effect but, in fact,
11 their driving ability is being impaired. So, this
12 needs to be discussed further.

13 DR. SEIDMAN: I would like to comment
14 briefly about the meta-analysis being peer
15 reviewed. We now have three analyses that appear
16 to justify the incredible safety and equal
17 effectiveness of these agents. There is the
18 meta-analysis that we contracted with the
19 University of Southern California; there is the
20 Food and Drug Administration's own analysis of the
21 world literature on these agents; and most
22 recently, there is a MEDLINE search that has been
23 performed by the American Pharmaceutical
24 Association that will be published in this month's
25 journal. All three studies conclusively state that

1 these drugs are safer and equally effective to the
2 first-generation antihistamines.

3 DR. BRASS: Thank you. I just want to
4 follow-up to reiterate a couple of points, and the
5 FDA can correct me if I misspeak. First, the
6 citizen's petition does not address at all the
7 status of what has been termed the first-generation
8 antihistamines and, therefore, that is not an
9 issue.

10 As you are well aware because you
11 participated, that previous panel and the FDA have
12 extensively reviewed the OTC status of those first
13 generation in a very comprehensive and deliberative
14 process and determined, based on data, that the
15 indication was an appropriate OTC indication and
16 that the first-generation agents were generally
17 recognized as safe and effective. Unless new data
18 is presented, I do not think the status of the
19 first-generation agents can be directly addressed.

20 DR. D'AGOSTINO: The other part of my
21 question was are we convinced, or is the petitioner
22 convinced that drug interactions have been handled
23 with these safety databases that do exist in our
24 experience? Is it long enough to have that
25 information?

1 DR. SEIDMAN: I would defer to the FDA's
2 own information. These drugs are over-the-counter
3 in 17 countries. There is 12 years of experience
4 in Canada -- exemplary safety record compared to
5 the first-generation agents.

6 I apologize for going back to my financial
7 slide but the healthcare system experienced over a
8 600 percent increase in antihistamine costs between
9 1993 and 1998, and that was secondary to the wide
10 acceptance of these agents being prescribed more
11 than any other antihistamines that were used
12 previously in first generation. I believe that the
13 science on the safety of these products is such
14 that there is no doubt regarding their safety.

15 DR. BRASS: Dr. Vollmer?

16 DR. VOLLMER: I just have a comment
17 regarding the cost analysis. One, and I think this
18 is going to be a recurrent theme throughout the
19 day, I hear from the introductory comments and from
20 materials in our packets that many of the issues
21 being presented to us are really not on the table
22 for us to be considering and, yet, we are going to
23 see a lot of these issues trundled out today. So,
24 it is helpful to keep remembering that.

25 Even ignoring that, I must admit that from

1 my own perspective it is very difficult. Not only
2 is the cost analysis not peer reviewed but I don't
3 have any details. Until today all I had was a
4 one-page summary of it so I can't even get my own
5 evaluation of it to determine whether there are any
6 potential flaws or limitations to it. So, it is
7 very difficult to assign much credibility to that
8 without any information above and beyond what we
9 have seen.

10 DR. BRASS: Yes, Dr. Niederman?

11 DR. NIEDERMAN: I have a question but
12 first a comment about the peer review. I think if
13 you are going to be placing as much value on these
14 two analyses as you are, it is unfortunate that you
15 haven't gone through the peer review process. I
16 don't understand, given the time lines here, why
17 you haven't done that. I think, as Dr. Vollmer
18 said, there is just not enough data in the cost
19 analysis to really make any kind of logical
20 conclusion and I think for something this important
21 you should have either not presented this or should
22 have presented it for peer review before you
23 presented.

24 But having said that, my two questions
25 relate to the lower but still measured sedation

1 potential of these second-generation agents. There
2 is some sedation and my question relates to your
3 model. First of all, I assume that you presumed
4 there was no sedation and, therefore, no accidents
5 associated with the second-generation agents, and I
6 am sure that that is incorrect given the data that
7 we have seen. And, that would be just one example
8 of the problems with this model.

9 Along those lines, with the proposed
10 labeling that Dr. Seidman showed there is no
11 warning to consumers at all about sedation
12 potential, and I wonder whether you feel
13 comfortable with that. Even though this is less
14 sedating than the first-generation agents, should
15 there be a warning if these were to be
16 over-the-counter because there is at least some
17 population that gets a sedation effect?

18 DR. NICHOL: Let me comment about the
19 first two issues that you raised. With regard to
20 the peer review status on the cost analysis, we
21 actually completed the meta-analysis approximately
22 two months ago and, consequently, as you well know,
23 the review process takes a considerable amount of
24 time. The reason that it was presented today is to
25 illustrate, using an existing model that had been

1 reviewed, the impact on the use of cellular phones
2 on automobile accidents -- modeling in a very
3 similar way to showing how important sedation may
4 be only with regard to motor vehicle accidents.

5 I think our concluding slide which pointed
6 out that there are a number of other areas that we
7 need to explore illustrates that there may be also
8 some other effects that will be very important to
9 society, such as the impact on workplace
10 productivity.

11 With respect to the second point that you
12 had about the assumption regarding sedation effects
13 for the second-generation antihistamines, you are
14 correct. We assumed that there would be no
15 sedation effects. Having said that though, it is
16 also important to realize that our base case
17 analysis assumed that the first-generation
18 antihistamines, instead of having a 17 percent
19 effect which was presented in Dr. Kern's
20 meta-analysis, we assumed about an 8.5 percent
21 sedation effect. So, we have the effect in terms
22 of the first-generation products. Actually, we
23 have done some sensitivity analysis with regard to
24 the sedation effects on the second-generation
25 antihistamines and it would not produce a profound

1 impact on the bottom line given the analysis we
2 have done so far.

3 DR. BRASS: Dr. Wood?

4 DR. SEIDMAN: I would like to just comment
5 before we go on to another question. The FDA
6 guidelines for the conversion from Rx to OTC are
7 clear -- can a patient in the over-the-counter
8 environment self-diagnose an allergy? And, the
9 labeling that is in place today on the plethora of
10 OTC antihistamines clearly documents that patients
11 can self-diagnose allergies.

12 Second, can the patient understand the
13 drug regimen in the OTC marketplace? With the
14 incredible direct-to-consumer advertising on these
15 drugs, taking a tablet once a day, there is no
16 question the patients can understand these drug
17 regimens in an over-the-counter environment.

18 Third, are there any side effects from
19 these drugs that would preclude their being sold in
20 an over-the-counter environment? Again, I
21 apologize. I go back to the direct-to-consumer
22 advertisement that has been approved by the Food
23 and Drug Administration that says that these drugs
24 have minimal side effects or side effects similar
25 to a sugar pill.

1 The FDA has already de facto decided that
2 these drugs are safer and equally effective to the
3 over-the-counter antihistamines. Why then do we
4 deny ready and easy access to these safer agents to
5 the forty million allergy sufferers in our country?
6 It just doesn't make any sense.

7 DR. NIEDERMAN: I didn't hear an answer to
8 the question about your label. You don't want to
9 put any mention of sedation in the label? Do you
10 stick with that?

11 DR. SEIDMAN: We defer the OTC labeling to
12 the Food and Drug Administration. Our proxy
13 labeling was for loratadine which has minimal to
14 zero side effects in terms of sedation. At least,
15 I haven't received a letter from the agency
16 instructing me to develop the OTC labeling. The
17 labeling was an example to show that it is easy to
18 label Claritin, Allegra and Zyrtec for
19 over-the-counter status.

20 DR. WOOD: One of the issues we have to
21 debate today I guess is whether patients can
22 self-diagnose and use these drugs safely. Though
23 we are not supposed to revisit the first-generation
24 antihistamines, it does seem to me that it would be
25 impossible to ignore the fact that first-generation

1 antihistamines have been widely promoted and
2 vigorously promoted by many of the same players who
3 are now telling us that these same patients can't
4 diagnose that.

5 So, I would like to hear if there is
6 evidence that people have used first-generation
7 antihistamines inappropriately, and was that
8 figured into the models that you used to calculate
9 the financial loss to patients and to society.

10 DR. NICHOL: No, we didn't do that. There
11 is no literature actually available that looks at
12 the inappropriate use of the first-generation
13 antihistamines.

14 DR. BRASS: Dr. Apter?

15 DR. APTER: I too am unaware of any
16 information about inappropriate use but I can tell
17 you, as a clinician, I see frequent inappropriate
18 use of antihistamines by my patients, and also
19 physicians referring patients may prescribe
20 antihistamines when, after a full evaluation, there
21 are no allergies and antihistamines would not be
22 appropriate. So, I think the question before the
23 committee and for those of you presenting today is
24 if antihistamines second generation are taken
25 inappropriately, is it safe.

1 DR. KERN: Well, I think this question of
2 self-diagnosis begins to run into the next
3 question, what if -- if the patient does take a
4 second-generation antihistamine inappropriately?
5 And, I think that is the important distinction as
6 to what we are talking about. The same would apply
7 with the first generation inappropriately, and the
8 difference has to do with the side effects. So, it
9 is not a huge leap but it is a logical leap that if
10 you were to take either one of those drugs
11 inappropriately, which one would have the greatest
12 consequences, negative consequences to the patient.
13 By and large, the way that people are looking at
14 the benefit to risk ratio, the second generation
15 have a higher benefit to risk ratio than the first,
16 and I think that would apply to that same scenario
17 in terms of people using the drug inappropriately.

18 DR. BRASS: Dr. Krenzelok?

19 DR. KRENZELOK: Safety is obviously a
20 major issue with the antihistamines. You have used
21 the Canadian information data from adverse drug
22 reporting and so on to make your case. In
23 California you have four poison centers that
24 generate about a quarter of a million poison
25 information reports a year. The American

1 Association of Poison Control Centers Toxic
2 Exposure Surveillance system generates about 2.2
3 million exposures per year. So, there is an
4 incredible database for you to potentially mine to
5 determine whether or not there are safety concerns.

6 I was just looking at the most recent
7 report from the AAPCC, and in '99 there were about
8 52,000 antihistamine exposures reported. About a
9 third of those actually ended up being treated in a
10 healthcare facility, which is an inordinately high
11 number. So with that, my question is have you
12 looked at these databases as another source of
13 safety information to determine the safety of all
14 three agents?

15 DR. NICHOL: Actually, I have not looked
16 at that information in terms of the utilization,
17 but it sounds like from the standpoint of the
18 utilization that you just discussed, the
19 sensitivity analysis that I referred to at the end
20 of my presentation is probably very relevant, that
21 we are looking at the possibility that there is
22 some substantial inappropriate use that may result
23 in additional utilization of the healthcare system.
24 The question is whether or not, from my standpoint,
25 there is a tradeoff with regard to additional

1 access. At this stage of the game, without any
2 further analysis, it looked to me from that
3 standpoint like the tradeoff is at least a wash.

4 DR. BRASS: Dr. Neill?

5 DR. NEILL: I am curious to know whether
6 there are any actual use studies in the U.S. or in
7 any of the currently OTC marketed countries that
8 address any potential risks accruing by membership
9 in a subpopulation. I have read the meta-analysis
10 that suggests that there are no risks and that
11 there are no subpopulations, either by virtue of
12 having metabolized the drugs, co-morbid conditions,
13 propensity to sedation -- that those subpopulations
14 don't exist. Without reviewing the individual
15 studies, I can't get a sense for whether or not
16 that has been looked at specifically in an actual
17 use study.

18 DR. KERN: This brings up the same
19 question having to do with this risk and looking at
20 an epidemiological point of view. I think the
21 incidence of these types of effects, like the
22 cardiovascular, are very small but they can be
23 significant. So, what it requires is clinicians,
24 as we have many in this particular audience. If
25 you make any kind of an observation where this may

1 be a possibility then I think it sets itself up to
2 look into this type of database. So, what it is
3 implying and in terms of what has actually happened
4 is that these particular connections between very
5 unusual type of events have not been observed and
6 have not been put together.

7 With regard to that database that was
8 looked at for the cardiovascular, that had to do
9 with Medicaid patients over a four-state
10 population, and they did a very good job of
11 identifying the incidence of the serious
12 cardiovascular consequences. So, the point I am
13 getting at is that if there are observations of
14 potential links these databases are available. To
15 go through a witch hunt to take these databases and
16 just try to find anything that may come up as being
17 a potential has never been found to be an effective
18 way of using science and using databases in order
19 to try to find out something that is meaningful.

20 So, you have to have the
21 pathophysiological link, like we talked about the
22 drug interactions with terfenadine. This begins to
23 make sense. The drug levels go high and you can
24 see the cardiovascular toxicities. It makes sense
25 from a physiological-pathological point of view.

1 So, this is what needs to be done. These databases
2 are available, if there is a particular observation
3 that would link somebody, to look in that
4 direction.

5 DR. BRASS: I just have to point out that
6 terfenadine was identified from a clinical signal
7 before the pathophysiology was identified. Dr.
8 Clapp?

9 DR. SEIDMAN: If I could just make one
10 comment before we continue? We are having some
11 excellent discussion I think on how much data is
12 enough, and I think we need to talk about that a
13 little bit. There is a wealth of information on
14 the safety and efficacy of these drugs. The
15 direct-to-consumer advertising on these drugs is
16 clear that these drugs are safe and equally
17 effective. Are we going to wait until December of
18 2002 for Claritin? Are we going to wait until 2007
19 for Zyrtec? When will we make these drugs
20 available to the American public?

21 DR. BRASS: You have made that point.
22 Please try to respond to questions only. Dr.
23 Clapp?

24 DR. CLAPP: Currently, all three
25 second-generation antihistamines are marketed and

1 indicated for chronic idiopathic urticaria. I am
2 curious as to how the Blue Cross petitioners plan,
3 suggest or propose prescription status for this
4 indication. Do they propose a nonprescription
5 status for the use in allergy, seasonal allergic
6 rhinitis, and a prescription status for chronic
7 idiopathic urticaria?

8 DR. SEIDMAN: When we filed the petition
9 we felt that making these drugs more broadly
10 accessible was in the public's best interest. We
11 will defer to the Food and Drug Administration for
12 specific labeling on those indications.

13 DR. CLAPP: So, your packaging for use in
14 allergy would have nothing to do for an indication
15 for urticaria? You wouldn't mention that in your
16 proposal? You wouldn't suggest that the patient
17 population have access to these drugs for the
18 purpose of urticaria?

19 DR. SEIDMAN: Again, I would defer to the
20 Food and Drug Administration for the specific
21 labeling for the over-the-counter versions of these
22 drugs.

23 DR. BRASS: Dr. Fink?

24 DR. FINK: Yes, since you have made public
25 access a major part of your petition, do you have

1 comparative data about use per 10,000 individuals
2 in those countries where the drug is OTC versus the
3 United States where it is prescription? That is,
4 is there actually increased use per population unit
5 in the over-the-counter countries?

6 DR. SEIDMAN: We have no data on that.

7 DR. SACHS: Going back to the
8 meta-analysis, and since we don't have a lot of
9 detail it is hard to tell, but apparently there
10 were about 200 or so studies you reviewed and only
11 30 were included. I am curious about why some of
12 those others were rejected, only because sometimes
13 that is where you lose some data that is important.
14 I don't know if the FDA had also looked at that,
15 you know, if we can accept this as the safety.

16 DR. KERN: That is always an important
17 part of the analysis, the rejection criterion. The
18 studies that we were looking at, once again, were
19 focusing in on adults, children, seasonal,
20 perennial allergies, and they were not focusing --
21 like the question that was brought up having to do
22 with another indication -- to be honest with you,
23 from my point of view, we didn't look at that. I
24 don't really have any comment. If that was to be
25 brought up in terms of whether this is safe and

1 appropriate for that group, I think we would have
2 to focus in on that particular group. We
3 eliminated urticaria from our focus because we
4 wanted to focus in on something that we felt was
5 large enough but we weren't able to focus in on
6 every particular indication that these drugs are
7 used for. Some of the studies that were eliminated
8 were based upon that indication. Other studies had
9 to do with the chemical reaction. People were
10 testing to see what the actual chemical reactions
11 were to these individuals and we eliminated those
12 because those particular studies used various
13 different types of measuring devices and we wanted
14 to focus in on the symptomatology and the
15 utilization of these drugs that would probably be
16 the most appropriate for the over-the-counter
17 population.

18 DR. BARAINUK: I have three quick
19 questions. You have done a lot of work, it sounds
20 like, on motor vehicle accidents. What is the
21 relative risk of the first- versus
22 second-generation antihistamines for motor vehicle
23 accidents? Do you have an odds ratio?

24 DR. NICHOL: Yes, we do. There are four
25 studies that have been done on that and their

1 estimates range from 5 to 16 relative risk. Our
2 base case analysis used 4 as the relative risk.

3 DR. BRASS: Just for my clarification,
4 those are studies comparing the two generations of
5 antihistamines?

6 DR. NICHOL: Those are studies
7 demonstrating the effect of first-generation
8 antihistamines, and it gets back to that issue
9 about whether or not we assumed that there was no
10 sedation associated with the second-generation
11 antihistamines.

12 DR. BARAINUK: So, do you have a number
13 for the second-generation antihistamines?

14 DR. NICHOL: No, there isn't a number for
15 the second-generation antihistamines.

16 DR. BARAINUK: And, for comparison what is
17 the relative risk for alcohol?

18 DR. NICHOL: The relative risk for alcohol
19 is roughly comparable as I understand it.

20 DR. BARAINUK: Do you have data or do you
21 just assume?

22 DR. NICHOL: No, we are using the same
23 estimating procedure that Redelmeir and Weinstein
24 did in the piece that they had published in Medical
25 Decision Making a year ago.

1 DR. BARAINUK: The second question I have
2 is on the common cold. The first-generation
3 antihistamines have a beneficial role there because
4 they have anticholinergic properties. The
5 second-generation drugs were designed because they
6 do not have those properties. Would you,
7 therefore, in your packaging contraindicate the use
8 of these drugs for the common cold? Many patients
9 make mistakes. They don't understand when they
10 have a cold; when they have allergic rhinitis.

11 DR. KERN: In terms of the consequences, I
12 would say for the common cold, no, it is not the
13 indication. For having to do with the idea that if
14 you have an allergic reaction that the patient is
15 experiencing, that is the indication for the first
16 or second-generation antihistamines, not having to
17 do with the indication for the common cold.

18 DR. BARAINUK: It raises the question of
19 self-diagnosis though and the appropriate use of
20 the drug.

21 DR. KERN: Yes, and this is what I think
22 is the real question in terms of the
23 self-diagnosis, and that is what is the overall
24 toxicity associated with the second generation
25 compared to the first because what you are bringing

1 up also applies to the first generation. So, you
2 have a relative issue that is going on. If
3 somebody misdiagnoses, what is the consequence for
4 that particular individual if we compare looking at
5 these two different groups of drugs? It is
6 becoming apparent that there is less risk to the
7 individual if they misdiagnose and they are taking
8 the second generation compared to the first.

9 DR. BARAINUK: Finally, what is your stand
10 on pregnancy?

11 DR. KERN: Well, pregnancy -- to be honest
12 with you, we looked at -- I don't know; I don't
13 know.

14 DR. BARAINUK: This is not a trivial
15 point. The current practice parameters recommend
16 diphenhydramine chlorpheniramine first-generation
17 antihistamines. The second generation are category
18 B, but they are not generally written into the
19 practice parameters as being indicated.

20 DR. KERN: I think this is correct.

21 DR. BARAINUK: Would many pregnant women
22 be using these drugs, and what would be their risk?

23 DR. KERN: In terms of the studies that we
24 looked at, to be honest with you, we did not focus
25 in on pregnancy as being a primary co-condition

1 that these patients have. So, I really don't know
2 exactly what the data is having to do with the use
3 in pregnancy.

4 DR. BARAINUK: So, you would
5 contraindicate the use in pregnancy?

6 DR. KERN: What I would do, if this is an
7 issue that is critical, is take a look at that
8 particular issue; that is what I would like to do.
9 At this point we don't have any data in terms of
10 the evidence to make that particular decision. We
11 didn't put that into our particular mix.

12 DR. BARAINUK: You didn't look at it? And
13 one final point, in general when drugs have been
14 switched to OTC the doses have been cut in half.
15 Is that so in general?

16 DR. BRASS: No, that is not necessarily
17 true.

18 DR. BARAINUK: These would be available at
19 the current doses?

20 DR. KERN: I would say yes. This is the
21 evidence that we have that have studied these
22 drugs. If you start reducing the dose
23 substantially, cutting it in half, then we need to
24 redo this particular type of investigation. I
25 think we need to look at the data that we do have

1 and evaluate it as it is with the particular doses
2 that have been studied, and not be tampering with
3 that unless you are proposing that we redo all
4 these particular studies.

5 DR. BRASS: There will be additional time
6 for the panel to ask questions this afternoon. At
7 this point, I would like to move on and turn the
8 podium over to Dr. Nader, from Aventis, to give the
9 first response to the petitioner.

10 **Response to Petition by Aventis**

11 DR. NADER: Thank you, Mr. Chairman.
12 Ladies and gentlemen, good morning.

13 [Slide]

14 We are here today to assess whether the
15 prescription to OTC switch of the non-sedating
16 antihistamines, as proposed by Blue Cross of
17 California, would be in the best interest of
18 patient safety and overall public health.

19 Aventis has given a lot of thought to this
20 important question, focusing, at FDA request, on
21 the safety perspective. We worked with our
22 scientists but also consulted with medical opinion
23 leaders, public health experts, as well as consumer
24 groups. We also carefully reviewed the sequence of
25 events that led to the withdrawal of Seldane from

1 the market. We finally analyzed the contentions of
2 the Blue Cross petition and their motivation.

3 [Slide]

4 We appreciate the opportunity to share our
5 findings with the panel members and with the
6 agency. Based on our analysis, we believe a switch
7 of Allegra from a prescription status to OTC is
8 premature. Allegra is still a relatively new
9 product. We have not yet accumulated the
10 experience and the data that would be essential to
11 consider a switch and, therefore, caution and
12 deliberation in our actions are necessary.

13 The switch of the non-sedating
14 antihistamines to an OTC status would be, in our
15 opinion, inappropriate, unnecessary and potentially
16 adverse to the patient's safety. This process
17 today is also unprecedented and, we believe,
18 unwarranted.

19 Finally, shifting the diagnosis
20 responsibility, the treatment accountability and
21 the cost burden from providers and managed care to
22 patients, as Blue Cross recommends, could have
23 direct and indirect unintended patient safety and
24 public health implications.

25 [Slide]

1 Let me first address why we believe the
2 switch of fexofenadine is premature. Fexofenadine
3 is still relatively a new compound. Allegra 60 mg
4 twice a day was first introduced less than five
5 years ago. Allegra 180 mg once a day -- Allegra 60
6 mg tablets -- were introduced just about a year
7 ago. Finally, Allegra 30 mg for pediatric use was
8 introduced also just about a year ago. No one can
9 argue that fexofenadine is safe when prescribed by
10 a physician and used as labeled.

11 Although we are confident in the excellent
12 safety profile of the drug, we are still at a
13 relatively early phase of drug characterization.
14 For example, fexofenadine is still in clinical
15 development. We are actively pursuing clinical
16 development work in asthma, in atopic dermatitis
17 and additional pediatric development. In this last
18 case, the FDA has mandated that the study protocols
19 include a thorough assessment of unanticipated
20 adverse reactions, particularly excitability,
21 somnolence, fatigue and/or hyperkinesia. The FDA
22 also asked us to run EKGs on all pediatric patients
23 included in the trial.

24 We are also actively studying fexofenadine
25 in a number of Phase IV safety and effectiveness

1 trials. We are also extensively monitoring the
2 post-marketing experience with fexofenadine,
3 including the evidence of adverse events. This
4 information led us to make a number of labeling
5 changes.

6 History provides all the more reasons why
7 we should not rush to a judgment on a switch.
8 During a painful period in our predecessor
9 company's past we had begun to evaluate a switch of
10 Seldane, another noon-sedating antihistamine. At
11 the time neither the company nor the FDA believed
12 there were any significant safety issues associated
13 with the drug. However, Seldane was ultimately
14 withdrawn from the U.S. market because of drug-drug
15 interactions leading to serious cardiotoxicity when
16 the drug was not used as labeled. We need to
17 remember that at the time of withdrawal Seldane had
18 been on the market for more than ten years and we
19 had accumulated over 24 million patient years
20 experience.

21 We do not refer to Seldane because of any
22 comparative concerns with fexofenadine but, rather,
23 to illustrate the importance of process; the
24 importance of time on the market; and the
25 importance of patient exposure. The

1 pharmacological properties of Seldane were also
2 very well defined at that time. Yet, only time and
3 the all-important post-marketing surveillance
4 system associated with prescription drugs enabled
5 the company and the FDA to identify and
6 characterize a rare adverse event in a timely
7 manner. Fortunately, once a drug is sold
8 over-the-counter the quality and the quantity of
9 adverse event reports declines to such an extent
10 that they are no longer reliable. Our ability to
11 continue building the post-marketing experience and
12 the product knowledge will effectively end.

13 [Slide]

14 We really do not comprehend the rush in
15 this process. The Seldane experience, the recent
16 withdrawals of PPA and astemizole from the market
17 provide compelling testimony that a switch at this
18 stage would be premature and that caution and an
19 orderly process should guide our decisions. We
20 have real concerns about this unprecedented process
21 of forcing medications to over-the-counter status
22 against the wishes of the manufacturers.

23 [Slide]

24 Blue Cross, a party with no legal or
25 regulatory oversight responsibility has requested

1 extraordinary action with respect to three distinct
2 drug products. To further distinguish this case
3 from the norm the three manufacturers oppose the
4 switch, in part because of an unanswered potential
5 safety and public health questions. Only once in
6 the last 18 years has the FDA approved
7 over-the-counter sales of a prescription drug
8 without the support of the drug's maker. The FDA
9 had, however, to switch the drug Alupent back to a
10 prescription status shortly after it went OTC.

11 We also believe it is scientifically and
12 medically incorrect to consider all the
13 non-sedating antihistamines as one category. The
14 non-sedating antihistamines are chemically and
15 pharmacologically different in the way the drug is
16 metabolized.

17 Blue Cross has brought what it suggests
18 are, and I quote, OTC products in Canada. I would
19 like to draw your attention to the fact that this
20 is not correct. In fact, according to Canadian
21 statutory requirements these drugs may only be sold
22 as listed on Schedule 3. In Canada, the equivalent
23 of the U.S. OTC status is the unscheduled status,
24 and the non-sedating antihistamines are, in fact,
25 listed on Schedule 3 in Canada. Schedule 3 means

1 that the drugs may only be sold under the
2 supervision of a pharmacist as a learned
3 intermediary who must be available, approachable
4 and accessible to assist the patient in making an
5 appropriate medication selection.

6 This Canadian experience is not comparable
7 to the U.S. OTC environment where medications may
8 be purchased at virtually any location including,
9 for example, a gas station. Unlike in Canada, no
10 learned intermediary would be present if these
11 drugs were available OTC in the U.S. Also, the
12 Canadian system provides for a free-of-charge
13 access to the physician at any time, and the
14 physician plays this free-of-charge learned
15 intermediary role. Unfortunately, this is not the
16 situation in the U.S.

17 From a process perspective, the
18 manufacturer typically initiates a switch by the
19 filing of a comprehensive NDA supplement containing
20 data from rigorous studies, including actual use
21 studies, label comprehension studies, together with
22 new proposed laboratory. In this particular case
23 no supplement has been filed. No studies have been
24 performed. No actual OTC use or labeling
25 comprehension studies have been conducted --

1 nothing that provides the appropriate information
2 as to the likely patient health impact of an OTC
3 switch.

4 The very companies who have the most
5 knowledge about the safety and efficacy of the
6 drugs are being given no more than 15 minutes each
7 to inform the panel of all the issues. It is
8 virtually impossible for us to adequately address
9 the proposed switch in this amount of time and in
10 the absence of guidance from the FDA as to the new
11 criteria by which we are to make this decision.

12 My question to the panel is why are we
13 doing all this? Blue Cross has publicly stated its
14 desire to save 18 million dollars, which represents
15 less than one percent of their operating expenses,
16 by eliminating reimbursement for non-sedating
17 antihistamine prescriptions and related doctor
18 visits. And, with all due respect, we do not
19 believe that helping an insurer improve its bottom
20 line by 30 percent through shifting costs from its
21 ledger to the pocketbook of consumers is a valid
22 enough reason to turn a proven OTC process upside
23 down.

24 [Slide]

25 More importantly, a switch could prompt

1 unintended consequences by changing the way
2 millions of patients suffering from allergic
3 rhinitis are managed. While Blue Cross arguments
4 trivialize allergic rhinitis, its diagnosis and its
5 treatment, prominent allergists, ENTs and other
6 specialists have spoken quite compellingly directly
7 and through their professional associations about
8 the potential adverse event of a switch on patient
9 care as defined by the joint task force on practice
10 parameters and by the allergy report which most of
11 you are familiar with.

12 [Slide]

13 These guidelines clearly highlight the
14 first steps of a successful allergy management to
15 be history taking, physical examination and
16 identification of environment and occupational
17 allergens. Further, these guidelines underscore
18 the importance of early diagnosis, differential
19 diagnosis, the management of coexisting or
20 complicating medical conditions, along with patient
21 specific education. The experts do not believe
22 that patients are safely capable of accurately
23 diagnosing their condition, identifying their
24 allergy triggers, let alone determining the most
25 appropriate course of treatment.

1 Frankly, no one can predict with certainty
2 the safety consequences of suboptimal care,
3 misdiagnosis or increased co-morbidities. And, no
4 one can predict with certainty how the decrease in
5 the physician patient contact will impact special
6 populations such as pediatrics and the elderly.
7 For example, the dose of the three non-sedating
8 antihistamines have to be adjusted for patients
9 with renal impairment. The doses of loratadine and
10 cetirizine have to be adjusted for patients with
11 liver impairment. Finally, fexofenadine is still
12 labeled as a Category C related to pregnancy. If
13 the experts are correct, the short-term gain to
14 insurers as a result of a shift of medication cost
15 to patients will definitely increase the overall
16 healthcare burden.

17 [Slide]

18 In addition, a switch of the non-sedating
19 antihistamine class would, frankly, turn the
20 current model of physician-patient interaction, and
21 may I add reimbursement to the patient by the
22 insurance company, on its head. The patient, not
23 the physician, will have to diagnose the condition.
24 The patient, not the physician, will have to select
25 what medications to take and how to take them.

1 Finally, the patient, not the insurance company,
2 will have to pay for the medication. I must
3 question how this new trial and error model of
4 healthcare benefits the patient. In trivializing
5 the management of allergic rhinitis, are we in fact
6 lowering the bar for other petitions seeking to
7 switch new classes of drugs in the future? In the
8 end, if Blue Cross has its way, not only will the
9 physician-patient relationship be undoubtedly be
10 weakened, but also patients will no longer be
11 reimbursed for their medication.

12 Studies show that even modest increases in
13 personal out-of-pocket costs, as projected by Blue
14 Cross, may be a significant barrier to the choice
15 of the optimal medication. A switch may result in
16 increased use of the less expensive antihistamines,
17 the very drugs which the Blue Cross contends are
18 dangerous.

19 [Slide]

20 Certainly, the Blue Cross petition does
21 not answer these questions, nor does it provide any
22 evidence that a switch will benefit patient health
23 and safety.

24 Their petition is essentially based on two
25 arguments. Blue Cross argues, number one, the

1 current sedating antihistamines available
2 over-the-counter are, and I quote, dangerous.
3 However, we question why Blue Cross' own formulary
4 continues to reserve non-sedating antihistamines
5 for patients who have either failed or are unable
6 to tolerate over-the-counter therapy. In fact, if
7 these products were unsafe, then the FDA would have
8 acted decisively to address the issue rather than
9 making decisions regarding another class of drug.
10 If, on the other hand, as the FDA has stated,
11 sedating antihistamines are safe as currently
12 labeled, then there is no basis for the petition in
13 the first place.

14 Blue Cross also argues that patients are
15 being denied access to the non-sedating
16 antihistamines because those drugs are not
17 available over-the-counter. In fact, a vast
18 majority of Americans have prescription drug
19 insurance and one or more of the non-sedating
20 antihistamines is approved on virtually every
21 formulary in the United States. Also, Aventis and
22 other manufacturers offer direct assistance to the
23 uninsured and the needy. Specifically, through our
24 patient assistance program and through sampling
25 Aventis distributes enough treatments to treat free

1 of charge 1.3 million allergy sufferers every year.
2 It is somehow difficult to understand why, as Dr.
3 Seidman suggested earlier, an OTC switch will help
4 the uninsured and the Medicare patients.

5 We certainly hope that Blue Cross will
6 never deny access to an important medication. If
7 Blue Cross is concerned about access and patient
8 safety, why does it have a policy that hinders
9 access to the non-sedating antihistamines by its
10 own members?

11 [Slide]

12 There are also regulatory and legal
13 liability issues to consider in the United States.
14 Until we have confidence that a switch will not
15 harm patients we are not prepared to subject
16 physicians, pharmacists or the company to liability
17 claims based on a premature entry into the
18 over-the-counter marketplace.

19 [Slide]

20 In summary, shifting the diagnosis
21 responsibility, the treatment accountability and
22 the cost burden from managed care to the patient
23 may have direct and indirect patient safety and
24 public health implications. Through petitioning
25 the FDA, Blue Cross of California is raising the

1 potential that the patient will be playing a risky
2 trial and error game with their health, with their
3 quality of life and with their money.

4 A switch could, in fact, change the
5 healthcare delivery model for the 40 million
6 Americans who suffer from allergic rhinitis. The
7 management of their disease will switch from a
8 physician-driven diagnosis and treatment and from a
9 reimbursed medication to a self-diagnosis, a
10 self-chosen treatment but also a self-payment.

11 It is possible that a switch may be
12 appropriate at some point in time, but there can be
13 no substitute for sufficient and reliable
14 post-approval clinical experience and patient
15 exposure data when evaluating an OTC switch. We
16 are not there yet with fexofenadine. We believe it
17 is premature, based on our market experience, to
18 consider switching fexofenadine to an OTC status,
19 and we did not find any compelling reasons to make
20 a snap judgment and a rushed decision on switching
21 the prescription non-sedating antihistamines to an
22 OTC status.

23 [Slide]

24 Finally, with your permission, let me
25 address the questions the FDA posed to the panel

1 today. Should fexofenadine be available for OTC
2 use? We believe this would be a premature move.

3 As to what concerns should be addressed
4 prior to OTC marketing, we believe that we must
5 continue first to assess the post-marketing data as
6 well as conducting post-approval clinical trials to
7 further characterize fexofenadine in a prescription
8 environment. Additional studies have to be
9 conducted to assess completely and comprehensively
10 the impact of an OTC switch.

11 I thank you for your time and attention,
12 and we definitely look forward to continuing to
13 work with you and with the FDA in our ongoing
14 efforts to improve public health. Thank you.

15 DR. BRASS: Thank you. We now recognize
16 Dr. Spiegel from Schering Plough for the second
17 response to the petition.

18 DR. KRENZELOK: May I ask if there is
19 really going to be no formal response from Pfizer
20 on this issue today?

21 DR. BRASS: My understanding is Pfizer was
22 invited to participate and declined the
23 opportunity. We have a couple of minutes during
24 the AV period, if Aventis would be willing to
25 answer a few questions at this point, and if there

1 are any panel questions for Aventis we might
2 proceed. I would ask you to use the microphone
3 right there. Dr. Fink?

4 DR. FINK: One comment and one question.
5 My comment is that I think we should really take
6 the cost issue out of this discussion. The
7 consumer pays for the cost of these drugs whether
8 it is through insurance premiums or out-of-pocket
9 expenses. So, we are really talking about cost
10 shifting, not cost savings, and it is inappropriate
11 for today's meeting.

12 But my direct question to Aventis is if
13 loratadine and cetirizine were granted
14 over-the-counter status, do you envision that you
15 would then seek over-the-counter status for
16 fexofenadine?

17 DR. NADER: To directly answer this
18 question, we did not assess, frankly, internally
19 what will be the course of action if cetirizine and
20 loratadine would go over-the-counter.

21 DR. DYKEWICZ: My question is what is the
22 relative amount of experience with use of
23 fexofenadine versus terfenadine? You mentioned
24 that terfenadine had 24 million years of patient
25 experience. What is that for fexofenadine? Also,

1 do you have any breakdown in terms of pediatric
2 experience?

3 DR. NADER: The total experience for
4 fexofenadine today is around 4.7 million patient
5 years. This includes all formulations. For
6 pediatrics it is very, very small. I would say it
7 is in the range of probably 200,000 to 300,000
8 since the product has been on the market for about
9 a year. The vast majority is actually the 60 mg
10 b.i.d.

11 DR. BRASS: Dr. Ford?

12 DR. FORD: I am from the Harlem Lung
13 Center at Columbia University. You mentioned a
14 potential for a shift in the paradigm in terms of
15 provider-patient relationships, in particular in
16 relation to self-diagnosis. I am not comprehending
17 how it happens because with first-generation drugs
18 my understanding is that patients actually
19 self-diagnose and utilize them. I am wondering how
20 it is that this would be different with the second
21 generation.

22 DR. NADER: We simply believe that one of
23 the elements that came with the petition has to do
24 with savings related to the direct physician cost,
25 and we believe that if there are savings it means

1 that the patients will see their physicians less.
2 Therefore, we believe that the patient relationship
3 will be hindered to a large extent. Today we have
4 the non-sedating antihistamines first generation
5 available OTC. The second generation, however, are
6 available by prescription and the physician has the
7 opportunity to discuss the treatment with the
8 patient. This opportunity will be lost, frankly,
9 if all the drugs are switched to an OTC status.

10 DR. BRASS: We will now proceed with Dr.
11 Spiegel's presentation.

12 **Response to Petition by Schering Plough**

13 DR. SPIEGEL: Thank you.

14 [Slide]

15 Well, a belated good morning but good
16 morning nonetheless. I am Dr. Robert Spiegel,
17 Chief Medical Office and Senior Vice President of
18 Medical Affairs at Schering Plough. I have with me
19 today a number of other representatives from
20 Schering Plough who are available for your
21 questions, as well as a guest we have asked to come
22 with us, Dr. Gary Rachelefsky, who is a practicing
23 allergist and a past president of the American
24 Academy of Allergy and Immunology, and a clinical
25 professor at UCLA.

1 You have been asked to day to assess the
2 appropriateness of loratadine in an OTC setting,
3 and this morning I will be describing why this
4 issue is actually quite complex and why we believe
5 it raises some major issues that must be carefully
6 addressed and review to responsibly evaluate such a
7 switch.

8 Schering Plough has been involved in
9 developing antihistamines for over forty years.
10 And, over the last ten years we have learned a
11 great deal about our drug, loratadine, and a great
12 deal about the allergy patient, the U.S. healthcare
13 system for allergy and the way loratadine is used
14 in that system. Indeed, loratadine and the other
15 second-generation antihistamines have played a role
16 in redefining the disease management of allergies
17 in the last decade. In this context, we too have
18 thought a great deal about the appropriateness of
19 loratadine as an OTC product, and we have
20 concluded, and we strongly believe, that loratadine
21 should be a prescription procedure.

22 This morning I am going to tell you why.
23 In your briefing book the FDA's OTC antihistamine
24 review team lists the OTC switch principles
25 developed in the early 1990s. They include the

1 question has a vigorous risk analysis been
2 performed. I think the answer to date is clearly
3 no.

4 [Slide]

5 The very serious issue here that requires
6 vigorous analysis begins with the following fact:
7 For many patients allergies are not appropriately
8 treated without physician management. There are
9 many different types of antihistamine users. There
10 are patients who use them for short-term periods
11 and patients who use them chronically. There are
12 those with co-morbid diseases and those without.
13 And, there are patients who use antihistamines for
14 colds versus those who use them as part of a
15 disease management regimen for allergies. We
16 believe you need to think very carefully about just
17 where on this spectrum of allergy is OTC use
18 potentially appropriate.

19 Secondly, we believe it is obvious that
20 more data and studies are necessary to
21 appropriately evaluate a switch based on unique
22 issues related to use. There are also many
23 unaddressed label development and label
24 comprehension issues raised by this proposed
25 switch, such as what patient population does the

1 label address? How long should a patient dose
2 before seeking medical attention? Should common
3 cold use be prescribed?

4 For these second-generation antihistamine
5 products, shouldn't label comprehension be
6 demonstrated for safe and effective use? Data on
7 these and other important issues are currently
8 lacking from any source. It would be a very poor
9 precedent to consider an OTC switch without such
10 analyses.

11 We would ask you today to carefully
12 consider the principles this committee and the
13 agency have established previously for OTC
14 marketing. Again, in the FDA's briefing document
15 the OTC antihistamine review team summarizes the
16 principles established in the 1990s for OTC
17 switches. It states actual use trials and label
18 comprehension trials may or may not be needed,
19 depending on whether there are any unique issues
20 related to use, warnings or directions that need to
21 be tested prior to market. It further states the
22 switch of a prescription drug to OTC marketing
23 requires a review of the post-marketing safety data
24 and a determination that a consumer can adequately
25 use the product in an OTC setting.

1 In the briefing book and today the FDA
2 reviews the intrinsic pharmacologic properties and
3 safety of the loratadine molecule. But Rx to OTC
4 switches raise issues beyond the simple
5 pharmacologic toxicity of the molecule. They raise
6 issues about the consumers who will use the product
7 and how they will use it. We believe there are
8 definitely unique issues in this case that, at a
9 minimum, require that research questions be
10 answered regarding actual use and label
11 comprehension. Moreover, we have established that
12 the current loratadine user likely is a different
13 allergy patient than the current OTC user of
14 antihistamines, and the current OTC antihistamine
15 user may well have a different spectrum of
16 allergies or colds than the current loratadine
17 user.

18 [Slide]

19 Finally, one must recognize that there are
20 major cost and healthcare policy issues implicit in
21 this OTC petition. Of course, there are financial
22 considerations in an OTC switch. The incentive for
23 the insurance companies is clearly economic. But
24 an OTC switch has profound cost and, thereby,
25 access issues for patients. This is particularly

1 problematic for Medicaid and the poor who may be at
2 the greatest risk but who may well be denied access
3 to the best available therapy if these drugs go
4 OTC. In today's presentation I will address these
5 issues which we believe are critical to your
6 assessment.

7 [Slide]

8 We begin today's discussion with a
9 recognition that for many patients allergies are
10 not appropriately treated without physician
11 management. This is a complex patient population
12 that includes simple as well as complicated allergy
13 patients, some of whom have a debilitating chronic
14 condition or potentially life-threatening
15 co-morbidity such as asthma.

16 Our position against OTC switch is based
17 on three medical findings. First, prescription
18 status may be necessary to protect and optimize
19 public health. Given the current prevalence of
20 allergies and what has been described as an asthma
21 epidemic in the United States, given the complexity
22 of allergy and co-morbid diseases, and given the
23 increased recognition of patient safety issues
24 related to overuse, under-use and misuse of
25 medications, now is not the time to drive allergy

1 patients further away from their physicians.

2 [Slide]

3 In order to improve overall public health
4 and the delivery of quality health care, the U.S.
5 healthcare system has seen a major change in
6 approach over the last ten years. This has
7 involved an emphasis on evidence-based medicine and
8 guideline-driven practice, and this is especially
9 true in the area of allergies and asthma.
10 Guidelines have been developed in this area which
11 include guidelines from the NHLBI, the task force
12 for allergic disorders, the WHO, recently issued
13 ARIA and GENA guidelines.

14 [Slide]

15 All of these guidelines is the area of
16 allergy emphasize the following approach for
17 optimum outcomes. Here is what occurs when a
18 learned intermediary is involved in the process.
19 It begins with an evaluation by the physician to
20 differentiate allergic disorders from other
21 diseases. There is then an attempt and a careful
22 analysis to uncover previously unsuspected
23 allergens and to assess important co-morbid
24 conditions that might exist. It also includes an
25 environmental assessment of whether there are

1 allergens in the patient's home environment, work
2 environment or school environment that might need
3 to be eliminated. Many patients don't need any
4 pharmacologic intervention but they need to change
5 the environment in which they are operating. And,
6 for selected patients antigen testing is
7 appropriate. This is followed by an assessment of
8 the need for pharmacologic therapy which can
9 include antihistamines, decongestants, nasal
10 steroids, for appropriate patients' immunotherapy
11 and, of course, when appropriate prescriptions for
12 co-morbid conditions. Then it ends with careful
13 follow-up, reassessment and compliance management.

14 OTC status with attendant self-diagnosis
15 and self-management would directly undermine this
16 physician-managed approach. The insurance
17 companies see a physician visit as a cost item. We
18 see it as a critical point of care in the disease
19 management process. As a physician, I would ask
20 you isn't it obvious that OTC status can only
21 produce suboptimal outcomes as compared to this
22 system?

23 [Slide]

24 Now let's turn to the second reason why
25 for many patients allergies are not appropriately

1 treated without physician management. That is, the
2 safety profiles of second-generation antihistamines
3 are well recognized in a prescription setting but
4 they are not fully known in a U.S. OTC system. The
5 FDA has reviewed the intrinsic pharmacologic safety
6 of the loratadine molecule, but as physicians,
7 pharmacists and healthcare professionals know, an
8 Rx to OTC switch raises safety issues beyond the
9 simple pharmacologic toxicities of the molecule.
10 They raise issues about the consumers who use the
11 product.

12 We know loratadine is a very effective and
13 safe product when used as a prescription product
14 under a physician's supervision. But we don't know
15 what that profile will look like in a U.S. OTC
16 setting.

17 [Slide]

18 We don't know how often it will be
19 inappropriately used to treat colds. We don't know
20 how often patients will overdose or under-dose.
21 Specifically, many patients dose their current OTC
22 antihistamines until they feel sedation. Will they
23 take a non-sedating antihistamine in excess in a
24 similar pattern? Moreover, no current OTCs are
25 currently once a day. Most are twice a day or more

1 frequent. How often will patients dose their
2 loratadine outside of labeling? I also ask what
3 will happen when this occurs with products that
4 contain 240 mg of pseudoephedrine? How many
5 patients will experience exacerbation of untreated
6 or unrecognized co-morbidities? Finally, how often
7 will patients have adverse outcomes as a result of
8 delay in seeking medical care?

9 These issues cannot be answered by simply
10 looking at the results of a spontaneous AE
11 reporting system in a post-marketing drug
12 surveillance database. These are notoriously
13 ineffective for addressing such questions.

14 [Slide]

15 Now let's turn to the third reason why for
16 many patients allergies are not appropriately
17 treated without physician management. Allergies
18 are frequently chronic, complex diseases with
19 serious co-morbidities, and the understanding of
20 these diseases has changed significantly in the
21 last ten years. Allergies are not just a runny
22 nose.

23 [Slide]

24 I mentioned at the beginning of my talk
25 that we have learned a great deal about allergies

1 in the last ten years, and most of that is
2 different from what we used to think. We have
3 learned that allergies are frequently chronic and
4 complex for many patients; that they are very
5 frequently associated with co-morbid conditions and
6 these can affect up to 40 percent of allergy
7 patients, and the co-morbidities can be serious and
8 their incidence and outcome can be affected by the
9 management of allergies. And, allergies are a
10 chronic condition that requires long-term
11 management, not just episodic symptomatic
12 treatment. Moreover, allergies have a particularly
13 large impact on children and adolescents.

14 [Slide]

15 It has been widely noted in the lay press,
16 as captured in this cover story from a year ago,
17 that allergies are widespread in the United States.
18 Let me spend a moment speaking particularly about
19 the importance of one of the most common
20 co-morbidities of allergies -- asthma.

21 Allergies have been estimated to affect 40
22 to 50 million Americans. Asthma affects 50 million
23 Americans and 4.8 million children. Of concern,
24 asthma prevalence has been documented to have
25 increased 75 percent during the period of 1980 to

1 1994, and during this period asthma deaths
2 increased from a rate of 11.5 per million to 18 per
3 million, resulting in 5500 deaths per year.

4 Given the seriousness of this public
5 health problem, HHS has just sent out a directive
6 to all state Medicaid agencies recommending the
7 implementation of disease management programs for
8 asthma. As I stated earlier, now is not the time
9 to drive patients further away from the physician.

10 [Slide]

11 The link between allergies and asthma is
12 now widely recognized, and 78 percent of asthma
13 patients have nasal symptoms and 38 percent of
14 allergic rhinitis patients have been noted to have
15 asthma. We know from our own experience that in
16 the year 2000 three million Claritin scripts were
17 co-prescribed with prescriptions for asthma
18 medications, affecting approximately 1.2 million
19 patients with asthma.

20 [Slide]

21 A number of studies have examined the
22 relationship between treatment of allergies and
23 asthma outcomes. It has been noted that treating
24 allergic inflammation in the nose can induce asthma
25 symptoms and lower airway hyper-responsiveness. It

1 has also been documented that asthmatic patients
2 with allergic rhinitis have higher medical costs,
3 and in one study cited here, a longitudinal study
4 was conducted in 783 students who were identified
5 while they were in college and then followed for 20
6 years. Resolution of allergic rhinitis symptoms
7 correlated with improvement of their asthma, and
8 worsening of their rhinitis was associated with the
9 persistence of asthma. So, there is a very real
10 reason to believe that suboptimal or inadequate
11 care of allergies might result in worsening
12 outcomes for patients with this major co-morbidity.

13 [Slide]

14 The previous slides reviewed some of the
15 reasons most allergists and primary care physicians
16 now treat allergies and antihistamines in a new
17 way. First-generation antihistamines tend to be
18 used for short-term episodic use. They tend to be
19 used for simple symptom relief in relatively simple
20 allergy patients. It is unknown what amount of
21 co-morbidity exists in these patients, but we do
22 know that over half of the use of the current OTC
23 antihistamines is for use in the treatment of cold
24 symptoms, not relief of allergy.

25 In contrast, the second-generation

1 antihistamines tend to be used for long-term
2 chronic use. Again, in our own data the average
3 use of Claritin is for more than 60 days.

4 Second-generation antihistamines tend to be used
5 for disease management for complex patients. We
6 know that they frequently have co-morbidities and,
7 as was noted earlier this morning, these products
8 are not effective for colds due to their lack of
9 anticholinergic activity.

10 [Slide]

11 Finally, there is a major public health
12 risk implicit in this switch proposal. Any
13 reasonable assessment of likely OTC pricing leads
14 to the conclusion that millions of patients, in
15 particular poor and Medicaid patients, will be
16 unable to afford the second-generation products as
17 OTCs. Many other patients who now have insurance
18 coverage will begin to make inferior medical
19 decisions based on their out-of-pocket costs, not
20 based on what is the best available medical
21 therapy.

22 Just as the medical issues are not simple,
23 so too the economic and directly related access
24 issues are complex. The Blue Cross petition
25 implies that as a result of a switch currently

1 available first-generation OTC antihistamine use
2 will decrease and that access to second-generation
3 antihistamines will increase and solve the
4 purported problems of the first generation. This
5 is not so simple. We believe this OTC switch
6 proposal represents plain cost shifting that will
7 decrease access and may reverse the current U.S.
8 trend.

9 [Slide]

10 Here are some real facts to consider. In
11 the U.S. today the first-generation products share
12 of total dosage days has been steadily decreasing
13 and in the year 2000 comprised only 17 percent of
14 the antihistamine market. In contrast, in the
15 current Canadian marketplace where all
16 antihistamines are OTC, the first generation have a
17 23 percent market share and their share continues
18 to rise slightly every year. So, there are often
19 unintended consequences of well-intentioned
20 actions. Market forces in an OTC marketplace in
21 the U.S. could well drive a return to growth in the
22 use of first-generation products.

23 [Slide]

24 Let me conclude by restating that Schering
25 believes we have learned a great deal about

1 allergies, and their complexities, and about the
2 different types of allergy patients. We are
3 convinced that loratadine is most appropriately
4 used as a prescription product.

5 In my presentation today I have focused on
6 several issues that should convince you that there
7 are, indeed, many unique issues related to use in
8 this situation. The fact that such a switch will
9 immediately affect tens of millions of patients
10 should be of concern and requires careful thought,
11 more study and certainly more data than have been
12 provided to date.

13 We have provided some insight into the
14 very real differences between the way the first and
15 second-generation antihistamines are used.
16 First-generation antihistamines are used primarily
17 as short-term acute therapy. They are used more
18 often for relief of colds than for allergy relief.
19 Second-generation antihistamines are used more as
20 part of a chronic disease management approach to
21 allergies, and they are generally used for more
22 than 60 days.

23 Given these unique and complex issues in
24 the allergy patient, as well as the potential
25 seriousness of allergies and their complications,

1 it would certainly seem appropriate to ensure that
2 the FDA OTC switch criteria and the rigor that has
3 been applied over the last decade to OTC switches
4 be applied here. In the FDA's briefing book the
5 OTC antihistamine review team reviews the so-called
6 PET principles evolved in the 1990s to assess OTC
7 switch proposals. These are the types of issues
8 and studies routinely looked to in a sponsor's
9 application for an OTC switch. Clearly, you have
10 not been provided with sufficient data to address
11 these issues.

12 Labeling must be developed and tested for
13 many of the issues raised here. Finally, if there
14 were ever a setting that would require an actual
15 use study, this would be the one. Actual use
16 trials are designed to assess how consumers
17 actually use the product in an OTC setting. It
18 provides a test of the consumer, not the drug. It
19 might also provide a perspective on outcomes under
20 the care of a learned intermediary versus real data
21 on outcomes when patients are on their own.

22 It has been stated today, and it will be
23 stated later this afternoon, that patients can
24 self-diagnose and self-treat allergies, but where
25 is the data? Actual use studies have been done for

1 almost all recent OTC switch proposals. Why
2 wouldn't they be expected in this case?

3 Interestingly, in the case of ketaprofine an actual
4 use study established that over 45 percent of the
5 subjects took more drug than the labeled dose.

6 Shouldn't we know similar results for loratadine
7 before recommending a switch?

8 [Slide]

9 In closing, let me leave you with this
10 thought, a key issue in determining whether OTC
11 status would jeopardize public health is obviously
12 safety. As you are aware, no drug is simply safe
13 or not safe. When FDA approves a drug it is
14 determining that its overall benefit to risk index
15 is appropriate for its intended use. In the case
16 of loratadine, we know its benefit to risk ratio is
17 very positive in the prescription setting under a
18 physician's management. We don't have sufficient
19 data about how the benefit to risk equation might
20 shift in the U.S. OTC system and, in fact, there
21 are reasons to believe that benefits could decrease
22 while risks could increase. Decreased benefit
23 could result from one-time episodic use versus
24 daily use; from indiscriminate use in colds; from
25 use without physician assessment and management;

1 and from patient self-treatment without
2 identification and elimination of obvious
3 environment allergens. Increased risk could result
4 from exacerbation of untreated or unrecognized
5 co-morbidities, inadvertent overdosing or delays in
6 seeking medical care.

7 These are the questions in the equation
8 that we would ask you to consider and evaluate
9 whether you really have adequate information today
10 to consider placing millions of patients at
11 potential risk of diminished efficacy, as well as
12 increased risk as they struggle to treat their
13 allergies. Thank you.

14 DR. BRASS: Thank you. Because of the
15 hour, we are going to hold the many questions for
16 the manufacturers until this afternoon, and at this
17 point take our break so that we can reconvene at
18 10:15 promptly to begin the open public hearing.
19 Thank you.

20 [Brief recess]

21 **Open Public Hearing**

22 DR. BRASS: I will remind all of the
23 public speakers to please include a conflict of
24 interest statement and any sponsorship for their
25 visit as they begin their remarks, and to please

1 mind the time limit as we have a full agenda. Dr.
2 Schenkel?

3 DR. SCHENKEL: Good morning. My name is
4 Dr. Eric Schenkel, and I am Director of the Valley
5 Allergy and Asthma Treatment Center in Easton,
6 Pennsylvania, and Director of Valley Clinical
7 Research Center in the same city.

8 Although I am a consultant and a clinical
9 investigator for a variety of pharmaceutical
10 companies, including the three companies mentioned
11 here, I am here on behalf of my patients. I am a
12 practicing allergist. I am down in the trenches
13 every day and, believe me, my patients are
14 extremely concerned and, granted, very upset about
15 the issues that have been presented here and what
16 has been presented in the media. I am also very
17 concerned about this potential switch of very
18 effective prescription drugs to an over-the-counter
19 status.

20 I would imagine there are many allergy
21 sufferers in this room. As you have heard upwards
22 of 40 to 50 million Americans suffer with some form
23 of allergic disease and their co-morbidities. And,
24 as we heard before, no one really ever dies of an
25 allergic rhinitis or runny nose but they make
